

Product Information

20 x 4.5" Dual Filter Assembly with Automated Softener System

The dual filter with automated softener whole house filtration system is the best and most capable solution for areas connected to the local water system which have **hard water**. The package is best suited to larger households with a high-water usage. The system utilises a twin 20x4.5" filter assembly that removes sediment, chlorine, taste and odour. After this the water passes into the SOL40-E1, our automated water softening system. The water softener are considered autonomous as they automatically regenerate the water softening resin using softener salt, preserving the softener resin for a long life.

- Filter 1 – sediment removal
- Filter 2 – taste odour removal
- SOL40-E1 – Calcium removal (water softening)

The system requires the two filters to be changed approximately 12 months depending on supply water quality, which is the only maintenance required for the system, as the automated softener backwash ensures the softener resin is kept in good condition versus other systems that require softener resin cartridge replacement on a regular basis.

Price for system is \$3380.00 incl GST exlc install cost
